#### ABSTRACT

This document presents the findings of the resource group in charge of finance for the master plan for higher education in the state of Connecticut. Specific areas addressed by the group are (1) expenditures for current operations, (2) revenue for current operations, (3) capital budgets, (4) budgetary procedures and expenditure controls, and (5) the independent institutions. February, 1973

To the Reader:

The 1972 General Assembly passed Public Act 194 which directed the Commission for Higher Education to develop a Master Plan for Higher Education in Connecticut by January 1974. In response, the Commission determined a structure designed to insure broadly based participation in the development of the plan. An overview of that structure is contained in the following document.

One of the most important elements of the Master Plan structure is the Resource Groups. Since September 1972, these groups, made up of over two hundred persons, have addressed themselves to major topics for the Master Plan. The reports of these groups have been made available to public boards of higher education with the request that the reports be disseminated to the chief executives and to the chief librarians of each institution and that the broadest discussion possible of the resource groups' topics be encouraged among faculty, students and interested groups. In addition, copies are being made available through public libraries and to organizations and governmental agencies which might be interested. Because the supply of the reports is limited, any interested individuals are permitted to reproduce any or all reports.

This report is one of eight Resource Group Reports. It should be recognized that the topics assigned to the Resource Groups are not mutually exclusive. Therefore, the reader is encouraged to read all eight reports.

The Commission for Higher Education is most grateful to the many individuals who gave freely of their time and energies serving on Resource Groups. The excellent groundwork they have provided in their reports will facilitate the deliberations of additional groups and individuals as the process of the Master Plan development continues.

#### INTRODUCTION

The following report has been prepared by the Resource Group for consideration by the Commission for Higher Education as it develops a Master Plan for higher education in Connecticut. To insure clear understanding of this report a number of points should be emphasized:

- The findings and recommendations are the considered judgment of the individual Resource Group. They do <u>not</u> necessarily represent an opinion or position of the Commission for Higher Education or any other group such as the Management/Policy or Review and Evaluation Group.
- This report is one of eight reports. The Resource Group reports, as a whole, are position papers for consideration in the development of the Master Plan. They should not be construed as constituting a first draft of the Master Plan. Subsequent to further discussion and comment, the recommendations made in reports may be retained, revised, or deleted in the Master Plan.
- The recommendations of the group may conflict with recommendations made by other groups. The reconciliation of conflicting recommendations will be considered in the process of developing a draft Master Plan.
- The development of a Master Plan is a dynamic process requiring continuing input from many sources. Although the Resource Group reports provide an important source of judgments about the elements of the plan, additional reaction, comment, and thought is required before an initial draft of the Master Plan can be completed.

All questions and comments concerning this report should be addressed to Master Plan Staff Associates, c/o The Commission for Higher Education, P. O. Jox 1320, Hartford, Connecticut 06101.

### PROCESS OF THE MASTER PLAN

## Groups Involved in the Master Plan

- i. <u>Commission for Higher Education</u>: The State's coordinating agency for higher education was requested by the General Assembly (P.A. 194, 1972) to develop, in cooperation with the boards of trustees of the constituent units of the public system, a Master Plan for Higher Education in Connecticut. The plan is to be completed and submitted to the General Assembly by January, 1974.
- II. Management/Policy Groups: A steering committee for the Master Plan process; membership consists of the chairmen of the boards of trustees for the constituent units, and the president of the Connecticut Conference of Independent Colleges. Liaison representation from the Governor's office and from the General Assembly are also represented.
- Plan. Membership is proportionately balanced between the higher education community and non-academics to insure that a broad spectrum of viewpoints be represented in group deliberations. Each group was assigned specific questions by the Management/Policy Group. In addition, each group was encouraged to address any other questions as it saw fit.
- IV. Review and Evaluation Group: A group invited to review, evaluate, and make comments on the Resource Group reports and successive drafts of the Master Plan. Ten members represent a wide spectrum of the state's business and public interest activity and three ex-officio members are from state government.

- V. Master Plan Staff Associates: Each of the constituent units of the public system and the Connecticut Conference of Independent Colleges have provided staff support for the Master Plan project. The staff associates serve a dual function: (I) each staff associate provided staff assistance to a Resource Group and, subsequently, (2) the staff associates will, in collaboration with the Commission staff, prepare the draft of the Master Plan.
- VI. Constituent Unit Boards of Trustees, including Faculty, Students and Administration: All boards of trustees of the higher education system are asked to review carefully the Resource Group reports and the Master Plan drafts to follow. It is expected that each institution will encourage the fullest possible discussion among faculty, students, and administrators.
- VII. The Public: In addition to the higher education constituencies noted above, a vital input to the Master Plan is the participation of all who are interested, including: individuals in industry, labor, minorities, professionals in short, all organizations and individuals interested in higher education. Comments are invited at any stage of the development of the Master Plan. However, for consideration for the initial draft of the Master Plan, comments must be received by April 1973 and in the final draft of the Master Plan by September 1973.

# AN OUTLINE OF ACTIVITIES FOR THE DEVELOPMENT OF THE MASTER PLAN

#### activity

1. CHE requests staff assistance from constituent units

6/72

- 2. CHE appoints Management/Policy Group
- 3. Management/Policy Group:
  - a. Identifies elements of Master Plan
  - b. Develops queries to be addressed
  - c. Appoints Resource Groups
- 4. CHE holds Colloquium Orientation meeting
- 5. CHE appoint Review and Evaluation Group
- 6. CHE approves interim report for transmitta! to Governor

12/72

- 7. Resource Groups complete and transmit papers to Management/ Policy Group
- 8. Management/Policy Group distributes Resource Group reports to Constituent units, Review and Evaluation Group, and other interested groups and individuals
- 9. Comments on Resource Group reports are submitted by Review and Evaluation Group, constituent units, and other interested individuals and groups
- 10. !nitial Draft of Master Plan is prepared and distributed to constituent units and Review and Evaluation Group
- II. Initial reactions are received and Draft of Master Plan is amended
- 12. CHE sponsors public presentation of amended Draft of Master Plan and solicits comments from all groups and individuals who are interested
- 13. Comments reviewed and evaluated and final draft prepared
- 14. Management/Policy Group receives final comments on final Draft of Master Plan from constituent units and Review and Evaluation Group, reports to CHE
- 15. CHE approves final draft of Master Plan and transmits it to the Governor and General Assembly

#### **FOREWORD**

Conventional wisdom instructs us to give a job to busy people if you want it done properly. I am happy to testify to the truth of this proposition. We gave twenty-one very busy people the job of analyzing the financial structure of higher education in Connecticut and making recommendations for its further development over the next five years. I think the following report will demonstrate that they were both diligent and effective in handling the task. I want to thank them for their contribution.

The effectiveness of any committee can usually be improved a great deal by good staff work. The Resource Group on Finance was fortunate to have the brilliant services of Brian H. Burke, Staff Associate of the Commission for Higher Education. His initiative, technical expertise, and hard work were indispensable to the Group. We warmly thank him for going the extra mile.

Edwin L. Caldwell, Chairman

## VIII. FINANCE: Fiscal Support and Resource Allocation

#### EXCERPTS OF PRINCIPAL FINDINGS AND RECOMMENDATIONS

\*\*Denotes Recommendation

#### Operating Expenditures

Projections of total state spending and spending of the four constituent units of public higher education, excluding the University

Health Center, reveal that ever the planning period the continuation of current expenditures per student in dollars of constant purchasing power, plus the restoration of spending for such things as maintenance and support which have had to be deferred in recent years, can be accomplished with a portion of the state budget no larger than that in 1972-73.

Factors having the greatest potential of imcreasing budget needs are:

- ...Collective bargaining
- ... Increases in part-time student enrollment
- ... Initimation of programs with low student-staff ratios
- ...Student financial assistance

Factors having greatest potential to reduce budget needs are:

- ...Degree options which reduce ##me required amount of formalized and supervised learning
- ...Avoidance of program duplication, course proliferation and other arrangements which cause small classes where they are not required pedagogically

## Tuition, Fees, and Other Revenue

2. The federal Higher Education Amendments of 1972 motwithstanding, the federal contribution to institutional budgets will on the average be a

#### Tuition, Fees, and Other Revenue (cont.)

constant or declining source of evenue in the early years of the planning period. The funding of those provisions in later years is conjectural.

- \*\*3. It is recommended that the Chancellor of Higher Education keep the institutions of higher education in Connecticut continually apprised of possible future funding from federal scurces.
  - 4. Even though enrollments are declining at the primary and secondary level shifts of resources from these areas to higher education will not take place in the planning period.
  - 5. Tuition is a likely source of increased state and/or institutional revenue in the first planning period, and the increase it will provide to the state General Fund exceeds the potential cost of adequate, statefunded student financial assistance.
  - 6. The yearly expenses for full-time Connecticut residents to attend public institutions of higher education in Connecticut (from \$1600 at a Community College to more than \$2500 at the University) represents a considerable sacrifice for the average Connecticut student and his family, and include tuition and required fees at the State College and University level considerably higher than the median of similar institutions of other states.
  - 7. Using required student <u>fees</u> (not tuition) at the University of Connecticut for illustrative purposes: The fee increases approved for fall 1973 and spring 1975 could be avoided if current and anticipated <u>institutional</u> bond obligations were refinanced on thirty year amortization schedules rather than the current twenty year schedules; and a fee

## Tuition, Fees, and C. onue (cont.)

reduction could be realized if the University-could remit tuition for a number of its needy students rather than provide of resetting scholarships from existing fees.

## \*\*8. It is recommended:

- a. that tuition charges at public institutions be graduated according to level of instruction, i. e., lowest at the lower division and highest at the graduate level, and that such tuition policy be accompanied by a program of incentive grants, based upon family income, for Connecticut students in public and private institutions in the state, and that this program be financed from the state General Fund, and that this plan involve institutional administration of the grants.
- b. that any fundamental change in tuition charges be phased into over a three year period.
- \*\*9. It is recommended that the current State Scholarship Program be expanded to be able to provide a number of awards equaling 10% of the high school graduates of a given year.
- \*\*10. It is recommended that thirty year amortization of bonds financed by <a href="institutional">institutional</a> fund sources be seriously considered by fiscal authorities.

#### Capital Budgets

11. The state pattern of capital spending is essentially unplanned, not coordinated with operating budget preparation, and bears little or no relationship with legislative authorization.

## Capital Budgets (cont.)

- 12. While there are certain definite capital needs at many institutions, a general increase in capacity of the total higher education plant in Connecticut is not needed.
- \*\*13. It is recommended that a time plan be settled upon in the current year to allow capital spending to proceed on a scheduled, continuous basis for those projects which are already planned and which the institutions can justify to the most essential for their particular purposes; and that lowest priority be given to those capital proposals whose principal effect is to make the system of higher education more extensive and whose existence must be justified on significant, overall, state-wide enrollment increases.

## Budgetary Procedures and Expenditure Controls

- 14. The existing calendar for operating budget approval thwarts rather than promotes responsive, flexible, and efficient institutional decision making.
- 15. The current policies by the Department of Finance and Control of pre-audit controls of day-to-day institutional spending interfere with educational decisions and prevent the development of management competence at the institutional level.
- 16. In the light of the purely incremental budget regulations of recent years, the targets of the budget allocation formula of the Commission for Higher Education (the SCHLDE formula) have been reduced to mere post budget indices.
- 17. The SCHLDE budget technique is a very useful tool for allocating budget recommendations among units, but its current application is not

# Budgetary Procedures and Expenditure Controls (cont.)

sufficiently sensitive to program cost differences.

- \*\*18. It is recommended that public institutions of higher education be allowed to make employment commitments, without prior approval, for a portion of the new positions included in the Commission for Higher Education budget recommendations for the subsequent fiscal year so that they may participate in professional labor markets at optimal times of the year.
- \*\*19. It is recommended that the Governor provide broad spending guidelines to the constituent units of public higher education, to be monitored and controlled by the boards of trustees and the administrative officers of each unit, and that existing pre-audit controls of daily institutional decisions be discontinued.
- \*\*20. It is recommended that to improve budget planning, accountability, and to enhance mutual understanding of administrative decisions, the development of a management information system proceed as rapidly as possible, and that the resources needed for its development be provided as an appropriation to the Commission for Higher Education.
- \*\*21. It is recommended that the procedures and formulas for allocation of funds among constituent units be modified to include program cost differences.

#### The Independent Institutions

22. Since there is neither significant overall enrollment expansion anticipated nor wide-spread excess capacity in the private college sector, and because of the existence of Special Act 53 and Public Act 140 of

# The Independent Institutions (cont.)

the state statutes, no new public programs to channel students into the independent colleges need be devised.

\*\*23. It is recommended that pilot contracts under Public Act 140 be funded and commenced as soon as possible in order to create the flexibility and preparedness needed to utilize the resources of the independent institutions whenever the long run interests of state can be better served by so doing.

INTRODUCTION

#### INTRODUCTION

The report of Resource Group VIII is submitted as a foundation and catalytic document in the development of that part of the Master Plan for Higher Education dealing with finance. It contains useful information and productive recommendations, but it is neither exhaustive nor final. An exhaustive study of the finance of higher education will take many months or years of continuous study and planning. At each turn there are challenging questions and a dearth of information and data.

A final statement on finance for this first Master Plan requires not only this report but the responses it generates. Our projections are mechanical enlargements of the current year and serve primarily to indicate ranges of possibility. The final projections of a plan should seize the opportunity to include judgments of what should be spent and where.

The timing of this report also deserves comment. First, relative to the development of the reports of the other Resouce Groups, this report ideally should be produced last so that it could discuss the potential cost implications of their findings and recommendations. But time constraints forced its production simultaneously with the other reports.

And second, its timing in an historical context might call for a quotation from Dickens: "It was the best of times, it was the worst of times..." It was worst of times because so much uncertainty prevails, especially with enrollment trends. Yet it was the best of times because we are not likely to overshoot our mark by being caught in the ascending phase of a rising curve, as happened to so many plans for higher education in the sixties.

\* \* \*

This report for the most part excludes comment on the University of Connecticut Health Center. The Resource Group believed that its rather limited time would be allocated more productively by concentrating on the matters of the four principal constituent units.

I. EXPENDITURES FOR CURRENT
OPERATIONS

#### I. EXPENDITURES FOR CURRENT OPERATIONS

#### A. Historical

The expenditures for current operations in the public institutions of higher education in Connecticut have experienced marked growth in the last decade, increasing more than four-fold. As can be seen from Table 5 on page 32 the sources of the reverses include not only governmental appropriations but student fees, receipts from auxiliary enterprises, and various other gifts and grants. That which underpins the operations, however, and which in fact determines the size of the other sources of revenue is the state general fund appropriation shown historically on Table 1. This appropriation has increased some 434% in the last ten years, growing from \$20.8 million in 1963-64 to an estimated \$111 million in 1972-73.

This increase is due primarily to a virtual explosion of enrollments in the decade of the sixties, a nation-wide phenomenon experienced in most all quarters of higher education. It is well known that the baby boom of the 1940's had its impact on higher education in the 1960's. The college age cohort (age 18-24) increased by 4.2 per cent per year in that decade, faster than that of total population and real income. In addition, the fraction of that age group enrolling in college also grew, causing an average annual enrollment growth of 8.3 percent per year, or a doubling over 8 1/2 years. This compares with 1.6% average annual growth in the fifties, or a doubling every 42 1/2 years.\* The growth of <u>public</u> higher education in Connecticut and the nation was even more dramatic, with enrollment more than tripling from 1960 to 1970. Full-time undergraduates in Connecticut increased from 13,279 to 45,220 and all students in all programs grew from 21,603 to 74,819.\*\*

Survey, 1971, pp. 5, 8.

<sup>\*</sup> Appropriation made to State Department of Education \*\* Incomplete due to above note

Disparities between appropriations and expenditures are due to spending restrictions and to administrative cautions to insure that spending does not exceed appropriation. NOTE:

The decade of the 1960's was a time of rapid growth and all economic activity, public and private. Personal income from 1960 to 1970 more than doubled both nationally (from \$401 billion to \$804 billion) and in Connecticut (from \$7 billion to nearly \$15 billion). During this same period the fiscal activity of the state government more than tripled, with general expenditures increasing from \$231 million in 1960 to \$789 million in 1970. It is clear, then, that the growth of the state appropriations for operating budgets must be seen in two settings - the enormous enrollment pressures and the very rapid economic expansion of the public and private sectors which occurred during the 1960's.

To turn again to the more recent ten-year period originally referred to (1963-64 to 1972-73), the increase in general fund appropriations for operating budgets reported above included the creation of twelve community colleges, the University of Connecticut Health Center, and the Commission for Higher Education. The general fund appropriations to those institutions that were in existence at the beginning of the period grew as follows:

	1963-64	(Millions of Dollars) 1972-73 (estimated)	Growth
State Technical Colleges (Technical Institutions until 1968)	• /	4.4	52 <b>9%</b>
State Colleges	6.6	28.0 .	325%
University (excluding the Health Center)	13 <b>.</b> 5	44.0	225%
Total	20.8	76.4	267%

This is not to imply that had those additional institutions not been added the total appropriations in 1972-73 would only have been some 76 million dollars. Clearly the existing institutions would have to have responded to the enrollment demands. The figures do show, however, that higher education in Connecticut has not merely grown larger but has also become

Expenditures for Current Operations (cont.)
quite different.

To give some additional meaning to the aggregate figures presented so far, we received many requests to see them as ratios with key economic, demographic, or educational parameters and then to compare these ratios with other states and with a national average. Our findings in this area are in Appendix A.

## B. Projections

The Resource Group felt that one of the areas in which it could be helpful to the entire master planning effort was in the projection of the general fund appropriations needed for institutional operation over the planning period and comparing this with our projection of total state spending over the same period. Our desire to do this was spurred by comments of Lyman A. Glenny in his talk at Colloquium on Higher Education in New Haven on September 25, 1972.

"I am quite sure that, with the exception of a few states, the proportion of the state budget going to higher education will be no greater in 1980 than in the next year or so--whether we have boom times or bad, or Republicans or Democrats in this office. Most states are already at this funding plateau. Others will quickly reach it. If funds increase it will result from a larger state income generally, not from a larger percentage of the state revenue. In the 1960's, enrollment doubled and budgets for higher education tripled, and the GNP going to higher education increased from one to two percent. The proportion of the GNP for higher education cannot keep that pace."

Since the projections were prepared without the knowledge of the findings or final recommendations of the other Resource Groups of the planning effort, they are essentially mechanical, based upon a structure assumed to be unchanging. Following the projections we will isolate and discuss those items which have the potential of altering them most significantly.

Preliminary to presenting the data there are a few ingredients which require discussion.

#### **Enrollment**

The most important factor is the enrollment component, which has seldom been so difficult to predict. For purely demographic reasons the projections of the Commission for Higher Education anticipated a decline in enrollment toward the end of the decade, but there are signs that the

peak may already be at hand. In short, uncertainty prevails. Therefore, we calculated the budgeting implications of high and low enrollment estimates rather than attempting to settle upon a specific figure.

#### Base Year of the Projections.

The nature of the projections is to assess what expenditure will be needed to maintain current per-student support in dollars of constant purchasing power over the planning period, and to estimate what portion of the total state budget this will require. What it does <u>not</u> do is assess the sufficiency of the expenditure of the current, or base year. In other words, inadequacies that may currently exist are built into the projections. The Group is aware of this and does <u>not</u> intend the projections to be forecasts of what <u>should</u> be spent, but rather as a broad-brush assessment of what expenditures could be made with the same proportionate share of the state budget. While we will make some general recommendations of increased support, a full examination of necessary qualitative improvements for the more than twenty institutions comprising the state system was not possible within the time constraints of this study.

#### The Community Colleges.

For two reasons the Regional Community Colleges deserve special comment. First, they comprise the only unit of public higher education in Connecticut which is still in a truly developmental stage. Therefore, they are particularly sensitive to perpetuating base year inadequacies as discussed in the above section. Also, their program development is in an evolutionary stage, with increasing emphasis on career and community service programs such as inhalation therapy or law enforcement. The enrollment growth indicated for the community colleges, particularly that in our high estimate, assumes that such programs will be initiated and attract

many students not traditionally involved in higher education. Because of these factors, the per-student support at the Community Colleges is increased each year in our high estimates to 1976-77.

The second reason for special comment stems from the fact that so many of the Community College buildings are rented, causing the lease costs to be included as part of the general fund appropriation to the unit for current operations. No equivalent cost such as debt service is included for the other constituent units. Lease costs in the Community Colleges in 1972-73 are estimated at about \$100 per year per student, but this would have to be reduced to account for the maintenance and upkeep that is either provided for in the lease or that is simply avoided due to non-ownership. Since the intention of our projections is to compare general fund appropriations of various years, and to compare each year with total state spending, we include lease costs for consistency. At the same time we state that existing accounting procedures do not readily reveal completely accurate comparisons of spending for students and total cost per student to the taxpayer.

\* \* \*

What items assumed to be unchanging or nonexistent in our assumptions might affect the size of future operating budgets?

#### Part-time versus Full-time Enrollment.

One trend which seems to have emerged and which does have increased-cost implications is the increasing number of part-time students. The principal impact is not in the instructional budget but in supportive services and facilities. For example, a counselor, be he in admissions, financial aid, academic advising, or personal counseling, does not do half a jobsbecause he is talking with a half-time student. In fact, there is reason to

<sup>\*</sup>Projections including the Health Center and the Commission for Higher Education are shown in Appendix B.

<sup>\*\*</sup>Appropriations include lease costs.

<sup>\*\*\*</sup>Technical College enrollments are <u>not FTE</u> but full-time only. A Head count of part-time students is not made from which to compute FTE.

believe that advising a part-time student is often more time consuming. than advising a full-time student. Nor does a part-time student sit in only part of a library chair. We were not able to assess the magnitude of this phenomenon, but we have little doubt of its potential to command increased resources. We recommend that institutions not only prepare for it but also devise methods of more systematically including the need for supportive services such as counselors and advisors in budget indices.

## Changing Distribution of Enrollment among the Units.

There is little or no consensus as to what will be the roles of the constituent units in the coming decade. We expect any change to be evolutionary and not to have vast redistributive effects over the first planning period. But the units to watch are the State Colleges and the Regional Community Colleges. There seems little doubt that the recent decrease of the birth rate will continue to reduce the student demand for teacher education programs, still the bulwark of the State College offerings. It follows that either the State Colleges will serve a smaller portion of the students in Connecticut public higher education, or they will initiate new or expanded programs. The nature of these programs will hold the budgetary secrets. Perhaps Resource Group I, in its discussion of the role and scope of constituent units, and Resource Group IV, in discussing programs and their location, will shed light in this area. unit costs, the program demand, and the program objectives, benefits, or output are the variables of importance for budget planning. Officers of the State Colleges have indicated an interest in offering bachelor's degree opportunities to correspond to new programs developed by the Community Colleges. Such programs have the potential of high cost, but shared facilities and other arrangements may hold these down.

There is little doubt that the state system of Community Colleges has the potential of providing genuine open access to the greatest number of citizens, of providing effective localized academic and career counseling and other supportive services, and perhaps of doing so at lowest unit cost. But it should be clear from the beginning that their per-student cost differentials from other institutions will not be as large as those that exist today. Any effort to accommodate a greater portion of the students in public higher education, be it with new or traditional programs, will require increased funding. The initiating of new programs in career and community service education will require not only developmental money, but generally increased spending per student due to the smaller student-staff ratios recommended by the Community Colleges in such programs. Also, the Community Colleges probably cannot attract large numbers of students into the traditional programs without generally upgraded facilities.

Changing Student-Staff Ratios: The enrollment boom of the sixties and the austerity programs of recent years have resulted in increasing student-staff ratios. The Finance Group does not feel that this gradual, attrition-based, essentially unplanned increase in student-staff ratios can go on without seriously affecting the quality of the education offered. However, there are methods of increasing average class size while retaining small classes where required. Some areas of potential benefit might include avoiding the proliferation of electives, or perhaps even the proliferation of requirements; eliminating unnecessary statewide or region-wide program duplication; or investing in flexible classroom buildings which can accommodate classes of various sizes. While the Resource Group did not have sufficient time to develop specific courses of action, we do

feel that strong institutional leadership, the provision of institutional flexibility, and interinstitutional cooperation are vitally necessary conditions for progress in the area.

Collective Bargaining: It seems to be a conditioned response in America that the advent of collective bargaining implies budget expansion. History certainly seems in large part to bear this out, so we must report that a collective bargaining agreement for state employees is a potential source of increasing the projections above. However, we feel there are good reasons for not having built the implications of collective bargaining into our projections. First, while most feel it is likely that a collective bargaining agreement will come out of the 1973 session of the Connecticut General Assembly, it is not yet certain. Second, even assuming that an agreement will be reached, it is not known who will be the bargaining units or agents. Third, and perhaps most important, bargaining is done within certain market realities. Because of the "buyers' market" for professional educational labor and the likelihood of items other than salary being bargained for, we feel that the four percent inflation already included in our projections should account for a major part of any salary increase.

However, we must acknowledge that the group was not in general consensus on this matter. We therefore offer below what the budget effect of a 5.5 percent per year salary increase would be. The method was to inflate the personal services portion of the total general fund appropriation (approximately 85%) at 5.5% per year.

TABLE 3

TOTAL PROJECTIONS OF TABLE 2

ASSUMING 5.5% GROWTH PER YEAR IN PERSONAL SERVICES

•	Low Estimate	<u> High Estimate</u>

1978-79	136,115,760	167,570,760

## New and Alternative Methods of Delivery of Higher Educational Services:

Creative new methods of providing education no doubt have many implications, some of which are budgetary. The Finance Resource Group defers to Resource Group V, which has been studying this for the past year. At this juncture we have only two comments. First, there does not seem to be any consensus that the use of new media equipment is any less expensive, especially in early years of development. We do not see this as a source of budget reduction in the first planning period. Second, to the extent that the term "alternative approaches" means external degrees, credit by examination, or the three-year baccalaureate, there is little doubt that it has savings potential. Both the nature of the savings and the chance of realization in the first planning period, however, are uncertain. It is entirely plausible that external degree programs will serve large numbers of new people and thus reduce unit costs, but at the same time increase the total budget. Decisions to provide large amounts of credit in an untraditional

manner are normally evolutionary in nature and are not likely to have much impact over the next several years. But if and when educational decisions are made to require considerably less formal and supervised learning in the earning of the bachelor's degree, the savings in terms of expenditures per student will undoubtedly be considerable.

<u>Student Financial Assistance</u>: While this is an expenditure which has increased cost implications, it is intimately tied to tuition policy and will be discussed in that section of the report.

\* \* \*

Budget Projections Compared to Projected Total State General Expenditures: Table 4 is a comparison of our high and low budget estimates with our projections of total state spending over the first planning period. Our methods of computation are described in detail in the appropriate footnotes. Columns b and c show projections of state personal income and general expenditures through 1979. Columns d and f are the low and high estimates of spending for higher education. Columns e and g show that both our low and high estimates represent a declining portion of the total state budget and that the tightest years are those at present and just ahead. Should these projections materialize, the conclusions are that the four constituent units of public higher education can maintain or improve upon current per-student support without having to bargain for a larger share of the state budget than at present. It seems that legitimate claims can and should be made in coming years for funds to restore spending in necessary areas such as maintenance and support which may have had to be deferred in recent years.

II. REVENUES FOR CURRENT OPERATIONS

28/29/30/

Table 5 on page 32 shows the sources of current fund revenues to the units of public higher education in three years since 1965-66. The data were obtained from the HEGIS reports for the United States Office of Education of the Department of Health, Education and Welfare. We feel that they are essentially self-explanatory but require perhaps two comments. First, while the category Tuition/Fees is used in the HEGIS Reports, only the term "fees" is pertinent in Connecticut. The tuition charged to students in Connecticut accrues to the state general fund and is not currently at the disposal of public institutions of higher education. Second, the distribution of funds among the revenue categories reflects the policy that the state government will support those functions which are primarily educational, and that all other activities will be paid for from other sources, predominantly student charges.

Our principal purpose in the deliberations leading to the writing of this section was to examine the possibility of new or changing sources of revenue. We will report on three.

## The Federal Government

One might expect that the writing of a master plan for higher education in 1973-would include a significant chapter on increased federal funding. The principal cause for that expectation would be the recent passage of Higher Education Amendments of 1972, potentially the most significant piece of higher education legislation imprecent history. However, the existence of the provisions of the Act and the funding of those provisions are two different matters. Depending on funding, the principal provisions of interest to the Resource Group on Finance are:

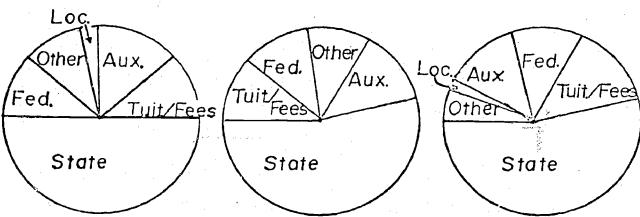

Increased student assistance based upon the "entitlement".
concept. That is, each student is "entitled" to a Basic

\*Source: 1965-66 and 1967-68 from <u>Financial Statistics of Institutions of Higher Education</u>, Office of Education, Department of Health, Education, and Welfare - 32 -

Opportunity Grant of up to \$1400 per year minus his "expected family contribution".

- Cost of Education Allowance to institutions enrolling students
   who receive entitlement grants and other federal assistance, and/or
   who increase the number of veterans enrolled.
- 3. A provision to assist the establishment and development of community colleges and other programs for occupational education.
- 4. A series of provisions to assist graduate education.

Most agree that due to the current efforts by the President to curtail total spending, and an apparent whift in priorities in the Department of Health, Education, and Welfare away from traditional higher education, the chances are quite slim that revenues from federal sources will increase much in the years immediately ahead. There is some hope that funding will proceed in the later years of the planning period but there is no way to tell how much this will represent.

## The Shifting of Resources from Primary/Secondary Education

Some have shown that historically in America there has been a very consistent relationship between increases in aggregate income and increases in spending on education.\* If this were to continue, with the anticipated decline in primary and secondary enrollments, the question arises as to whether funds might be shifted from the primary and secondary schools in the direction of higher education. With the critical assumption that the historical relationship between GNP and spending on all education will continue, a theoretical case can be made for this shifting of resources without damaging the necessary per student or per staff support in "lower" education. But it is the consensus of the Resource Group that this will \*Byrnes and Tussing, op. cit., p. 18.

not happen in Connecticut. First, since state support for primary and secondary education in Connecticut is not very great (the state contributed 31.3% of local school budgets compared to a national average of 40.7% in 1969-70) there is simply not a large amount that could be shifted. Second, the freeing of monies due to declining enrollments may spur communities to either improve program quality or more vigorously enter new programs such as those in early childhood education. Filmally, and perhaps most likely, reduced needs at the primary/secondary level will allow for local property tax relief.

## Tuition and Fees

Nothing occupied so much of the Resource Group's time as discussions concerning what portion of the total educational bill should be borne by the student and his family. While there was not complete consensus on each item it is an area where we feel we can provide productive discussion and recommendations. This section will contain three parts:

- I. A presentation of the current tuition and fee structure in Connecticut, including:
  - a. what portion of total educational cost to the student the current tuition and fees represent, and
  - b. what portion of institutional revenues fees represent.
- 2. A discussion of the rationale for the existence and level of tuition.
- 3. The Resource Group recommendations regarding tuition and financial assistance, including several possibilities and their financial implications.

## The Current Structure of Tuition and Fee Charges in Connecticut

There is an important distinction in Connecticut between  $\underline{\text{tuition}}$  and  $\underline{\text{fees.}}$ 

Tuition - a charge made to all students in public higher education in Connecticut the revenues from which accrue to the state General Fund and are not earmarked for higher education. These charges per year in 1922-73 are:

For Connecticut residents

	The University of Connecticut	\$350
	State Colleges	\$300
	Regional Community Colleges	\$200
	State Technical Colleges	\$200
AII	Non-Residents	\$850

Institutional Fees - charges made to all students in public institutions of higher education in Connecticut the revenues from which remain which rem

## Tuition and Fees as Part of Total Student Expenses

There seems to be considerable confusion in the public mind concerning the cost to students of public higher education in Connecticut. To reduce this confusion somewhat we present Tables 6, 7, and 8. Table 6 shows
the estimated 1972-73 student expense budgets at four public institutions
in Connecticut. The data were submitted by the institutions' financial aid
offices of the itemization is left as it was submitted. Table 7 is

Source: Howard Bowan and Paul Servelle, American Association for Higher Education, Washington, D. C., August, 1972.

Assumes that only full-time students forego income. Of the 8,714,000 students enrolled in 1971-72, about 6 million were full-time. U. S. Office of Education, *Projections of Educational Statistics to 1979-80* (1970 edition), pp. 22, 23, 26.

<sup>&</sup>lt;sup>3</sup>Refers to 6.9 million students in full-time equivalents (*Ibid.*, p. 29). Operating costs of institutions omit auxiliary enterprises. These are included partly in incidental expenses of students and partly in the living costs of students that are not part of the real costs of education. Students would have board and room costs whether or not they were in college. Operating costs also omit capital costs because data are not available. Hence the figures are understatements.

comparison of tuition and fees at public institutions in Connecticut with those of twenty other states.

Table 8 is reproduced from a monograph by Howard Bowen and is a national summary of the costs of higher education. The part relevant for our purposes is the costs borne by the student which includes the concept of foregone earnings.

While again much of this is self-explanatory, a few comments are warranted. First, the discussions of "low cost" public education are obviously relative ones. While there is no doubt that the price to the student is less than it is at most independent colleges, the cash outlay represents a considerable amount of sacrifice and planning for the average student and his family. Second, while the existence of tuition in Connecticut is only two years old, the combination of tuition and fees at the four year colleges is well above the median of the states studied. Our third comment concerns the concept of foregone earnings, shown in Table 8 to be some \$5,100 per year per student. While this "opportunity cost" is not often considered by the layman, it is a fundamental item of any professional economic analysis. Its inclusion is important in that it shows that the cost to the student is not only the cash outlay required for college attendance, but the income, savings, seniority, longevity, and other benefits that he does not receive while he is a student. Attendance presumes that the benefits exceed the costs.

## Tuition and Fees as a Portion of Institutional Revenue

Table 5 shows that the operations of the public institutions in Connecticut depend upon a good deal more than the state appropriation, and that charges to students make up a major portion of that difference.

As indicated above the level of the fee is determined by the amount of funds needed to support operations which are not primarily educational, such as student union facilities, campus security, athletics, additions to financial aid and the amortization of dormitories and other non-educational facilities. These fees were traditionally rather low, but in recent years, especially when added to tuition, they have become quite significant. At the University, for example, fees will increase next year from \$290 to \$350 per year in addition to the \$350 tuition. Generally increasing cost of services, as well as a new state policy requiring the University, rather than the State Comptroller, to begin to pay the retirement costs of employees in these service accounts, have caused this increase and possible increases at other institutions.

Several Group members, members of the Commission for Higher Education, as well as other interested officials and citizens have expressed concern about the level of fees charged. We have examined the issue and feel that there are steps that can be taken to reduce fees, or at least limit their increase. Two specific examples will be offered. We will use the University of Connecticut Auxiliary Services Fund for both examples, but feel the concept could apply to any public institution.

The Auxiliary Service Fund of the University of Connecticut budget represents approximately 25% of the yearly institutional revenues and expenditures. The largest source of revenue to this account is studer' fees. These fees plus the revenue from those activities which operate at a surplus, must be sufficient to meet current obligations plus provide for an adequate surplus of working capital. Both of our recommendations will reduce the yearly obligations of the fund, thus reducing the fees needed for revenue.

## Change of Bond Amortization Schedule from Twenty to Thirty Years

The University finances, from its own auxiliary revenues, dormitories and other non-educational facilities and does so on twenty year amortization schedules. There are existing obligations of varying length of some \$32 million, plus an anticipated \$2.5 million in new issues, to be paid in declining installments over a twenty year period. These payments range from nearly \$3 million in 1973-74 to some \$2.5 million in 1978-79, the last year of the planning period. However, if the current obligations were refinanced and the new issues written for 30-year amortization, the yearly payment would be reduced each year to less than \$2 million in 1978-79 This reduction would eliminate the need for the already approved \$60 per year increase in fees 1973-74 and the planned \$30 increase in 1974-75. According to the schedule there would be no fee increase needed until the spring semester, 1977. It should be clear that the increase in the bond length and the need to finance at a higher interest rate will increase the total payments nearly \$12 million, from \$34.7 million to \$46.3 million. The Resource Group recognizes this but feels that the reduced cost per student may warrant its serious further consideration by fiscal authority of the state.

## Reduction in the University Contribution to Student Financial Assistance

In the year 1971-72 the University, from its own sources, provided approximately one million dollars in financial aid, \$750,000 of which was from the Auxiliary Services Fund. The Resource Group later in the report recommends that adequate financial assistance for all Connecticut residents in institutions of higher education in the state can and should be financed from the State General Fund revenue. If this were to supplant the \$750,000 currently financed by student fees, it represents a potential reduction

of \$40 per year per student.

Again, we have used the University for purposes of illustration, but believe that these and other steps are potentially applicable to all other public institutions.

## Tuition: What Part of the Cost Should be Borne by the Student?

The question of whether to charge tuition and, if so, at what percentage of cost, raises an issue as old as the study of public finance. The is the benefit principle of taxation, which says: If the benefit of a public activity or service accrues solely to the individual, it should be paid for by a user tax representing full-cost pricing; if the benefits are not divisible, but rather reside with the society in general, the service should be financed through general tax levies. It follows that those programs from which the benefits are to both identifiable individuals and to the community at large, the method of finance is a mix of subsidy and user taxes. While the full implementation of this principle as a working guide for policy would require the accurate definition and comparative measurement of benefits - a hopeless task in most cases - it does capture the issue. There are a few economists and educators who support an extreme position on either end of this argument but most feel that the benefits of public higher education in this country have been both individual and societal. The preceding discussion suggests that the student and the public share the costs of public higher education, which of course they do. The more difficult question is whether the student's share should be increased or decreased, and by how much. There is considerable pressure these days for generally increasing the student's share, a position held by a good number of members of the Resource Group. It is argued that the benefits are predominantly to the individual in the form of increased earning

power, that low tuition is a windfall for the middle and upper classes and that those who can pay should pay. Those arguing for the student's paying a smaller portion maintain that the tradition of low cost public higher education has been to the general public's benefit, and that it provides for more democratic access to it. It is argued, conversely, that it would be to the public's detriment if increased prices slowed the absorption of education by the populace, reduced the chances for self improvement and upward mobility especially for those chronically disadvantaged, and increased the number of high school graduates entering the labor market. Another argument for low tuition is that is represents the way the middle-class pays for most things. That is, paying for education over time through general tax levies supports and reflects the concepts of insurance and time payments. The chances of being able to provide higher education for one's children are better and the financing is more manageable. While those arguments were not fully reconciled, the Resource Group has arrived at some general points of view or recommendations which attempt to take the best parts of each side of the above argument. They will be discussed briefly here and made as formal recommendations in the next section.

First, we recognize that it is extremely difficult to enumerate, define, and measure benefits. But we feel that a plausible argument can be made that the Community Colleges, Technical Colleges, and the lower division generally are the "front line" of open access and equal opportunity, and as such are the most appropriate vehicles to support publicly stated goals in these areas. This part of higher education, therefore, deserves the greatest public subsidy, or the lowest tuition. This is not to say that the Resource Group feels that there is no public benefit from upper-division or graduate instruction. Clearly, there are many benefits, and tuition should thus be far short of full-cost pricing. But by current standards

of society, there is increased likelihood that those people earning baccalaureate, professional and graduate degrees will enjoy increased earning power and a higher standard of living. Therefore, whether tuitions are generally high or low, they should be higher on this level than they are at the lower-division. Second, to the extent that the above recommendation increases tuition, these funds should be used to <a href="improve">improve</a> opportunity and equity, making our institutions more accessible than they are now. No tuition recommendation of the Group is intended to construct economic barriers for those of low income. Our third suggestion is primarily pragmatic. It is possible that increased tuition, or the mere announcement thereof, will affect enrollment. We know little about the nature of current demand for higher education, but we feel that it is likely to be very elastic, or price-reactive. Because of this uncertainty and desire not to get abruptly out of line with neighboring or similar states, we feel it wise to ease into any tuition change over a period of three years.

## Recommendations for Tuition and Financial Aid

Prior to outlining our recommendations we make two observations:

- While the costs of imposing or raising tuition are many the members of the group see three potential benefits:
  - a. It raises revenue, if enrollments do not decrease markedly.
  - b. It <u>can</u> improve equity and opportunity, if coupled with adequate financial assistance.
  - c. It may ease the pressures on the private institutions.
- 2. If the 18 year majority ever allows students to disclaim parental income in the determination of need, tuition will become a "bad tax" in that it will not charge those intended to be charged.
  Connecticut would have two alternatives:

- a. Eliminate tuition and finance higher education from a just general tax system.
- b. Provide the financial resources needed to fund a tuition postponement option based upon post-education income.

## Recommendations

### We recommend that:

- I. Tuition be graduated according to level of instruction. That is, tuition would be lowest at the Community Colleges, the Technical Colleges, and in the lower-division of the State Colleges and the University, and highest at the graduate level.
- There be increased financial assistance for low and middle income students and that such assistance be funded from General Fund revenues.
- 3. Any change in tuition policy be phased into over a period of three years.

## Alternative Tuition Possibilities

Below are six possible plans of tuition charges. One of the plans is that which currently exists, while the others compute tuition on the basis of instructional cost. The computations of instructional cost are shown in Appendix C. The Resource Group believes this is a useful approach but does not deny there are others. One variation that comes to mind immediately is to reduce the tuition computed for the Technical Colleges to that at the Community Colleges. The key ingredient, however, is that tuition be graduated according to level. The existing plan does not completely conform to this but is added for comparison.

## ALTERNATIVE TUITION POSSIBILITIES

Alternative A Tuition equals:

0 at lower division

30% of instuctional cost per student at upper

division and graduate level.

<u>Alternative B</u> Tuition equals:

10% of instructional cost per student at the lower

division.

25% of instructional cost per student at the upper

division and graduate levels.

Alternative C Tuition equals:

20% of instructional cost per student at all levels.

Alternative D Tuition equals current tuition charges:

\$350 per year at the University.

\$300 per year at the State Colleges.

\$200 per year at the Community Colleges and Technical

Colleges.

<u>Alternative E</u> Tuition equals:

30% of instructional cost per student at all levels.

Alternative F Tuition equals:

20% of instructional cost per student at the lower

division.

50% of instructional cost per student at the upper

division and graduate levels.

## Policy and Program Recommendations for Financial Assistance

The Resource Group has taken the liberty to describe our recommendations for financial aid programs in this section, rather than in the section on expenditures, because we see it as intimately tied to tuition policy. This section will contain three policy recommendations and two specific program recommendations.

## Policy Recommendations

We recommend that:

The imposition or increase of tuition be coupled with adequate financial assistance so as to improve equity and opportunity, and such assistance be funded from state General Revenue.

- To truly equalize opportunity, loans <u>not</u> be the principal component of an aid package; however, some self-help (work or loan) be a part of every aid package.
- 3. The award schedules of any program be tapered so that they do not end abruptly at a \$12,000 family income.

While Recommendation I was made previously, we feel it bears mention in both sections. Recommendation 2 asserts a belief by nearly all the members of the Group that incurring a large debt to finance one's education is detrimental in two ways. First, it is a discouragement to low income people and, as such, is not a vehicle for equal opportunity. And second, existing loan programs put the repayment burden in the part of a person's life when his income is likely to be the lowest and when he or she is likely to be in the family formation stage. We do feel, however, that it is wise if all students, through work or a moderate amount of borrowing, contribute to the financing of their education. While we formulated no firm program recommendation, most members of the Group feel that Conjecticut will need to develop some form of income contingent loan program.

Recommendation 3 represents our desire to avoid a weakness of so many programs of this sort. That weakness is having the payment brackets end too abruptly and failing to recognize the needs of many middle income students and their families. The enrollment at public institutions should be representative of entire populace and not only of the poor and the rich.

## Financial Aid Program Recommendations.

It is recommended that a Scholar Incentive Grant Program be instituted and funded from General Fund revenues, and that all Connecticut residents attending institutions of higher education in Connecticut, public or private, be eligible.

<u>Size of Grants</u>. Awards should be tapered into perhaps twelve brackets but would average the following amounts.

Family Income	<u>Grant</u>
\$ 0 - 4,999	\$ 950
5,000 - 8,999	. 600
9,000 - 11,999	450
12,000 - 15,000	250

## Cost of Program.

Family Income	Approximate Number of Students	× Grant	= Cost
\$ 0 - 4,999	4,000	\$ 950	\$ 3,800,000
5,000 - 8,999	4,500	600	2,700,000
9,000 - 11,999	5,500	450	2,475,000
12,000 - 15,000	5,500	250	1,250,000

The group discussed its preliminary findings and recommendations with executive officers of the four public units of higher education in the state. Each requested that part the funds for this program be

administered by the institutions. This could be done by an allotment of funds or by tuition remission. The Group agrees that this has merit, and may in fact be required for effective administration of the program, but any arrangement should contain the following ingredients:

- a. As the name implies, it should be an incentive to pursue higher education for anyone who desires it and who is qualified or qualifiable.
- b. It should not be restricted to those attending public institutions.
- programs, but in no case should an award or arrangement of awards be in excess of a student's need.
- 2. The existing State Scholarship Program be expanded so as to award annually a number of scholarships equal to 10% of the number of high school graduates each year.

## Cost of the Program

The number of awards would have to increase from 1600 to approximately 5000, requiring a budget increase from 1.3 to 4.5 million dollars. However, depending upon funding of the 1972 Amendments, it is possible that half of this increase will be provided by the federal government.

3. An independent Student Financial Aid Commission be established to replace the existing State Scholarship Commission, to coordinate state efforts with the Student Aid Provisions of the federal Higher Education Amendments, 1972, and to develop with the

institutions of higher education in the state uniform guidelines for the determination of student financial need.

In conclusion, it should be clear that in the minds of the members these programs are inextricably linked to a program of tuition charges, and that such charges provide more money into the General Fund than is required to support them.

III. CAPITAL BUDGETS

## III. Capital Budgets

The Resource Group was not able to develop a section on capital budgets similar to that on operating budgets, as it had intended. The lack of appropriately categorized capital spending data is the first problem. In no state office were we able to get capital spending figures for higher education. The Connecticut Public Expenditures Council has devoted considerable efforts to the assembling of such information, but their series is only through 1967. Second, the separation of capital and operating budget calendars in the state, and the basic unconnectedness of legislative authorization and actual fund allotment, make this a very different problem from that of operating pudgets. The experience of recent years is illustrative. In 1969 the Connecticut General Assembly authorized, for all state agencies, some \$800 million in capital funds, an amount nearly equal to a year's total governmental revenue at that time, only to be followed by an executive freeze of nearly all capital projects. For higher education alone, as of July, 1972, there existed more than \$80 million for general obligation bonds authorized but unallocated.

Capital spending in most cases means building. With the peak of the recent enrollment boom appearing to be nearly at hand--and considering space available at both public and private institutions--it is our assessment that the existing plant is as <u>extensive</u> as it needs to be for most programs for several years. There is need, however, for certain kinds of space, for qualitative improvement, for upgraded facilities, for new facilities where unsatisfactory leasing arrangements now exist, and for facilities which will combine operations which are now separate, and thus

promote economy. For example, replacing an unsatisfactory Community College lease with capital construction is <u>not</u> seen as making the plant more extensive.

The Resource Group feels that it would be to the benefit of the general public, the government, and the higher education community if all parts of the capital budgeting process—planning, legislative authorization, project approval, and actual fund allotment—be allowed to proceed on a reasonably continuous basis, with regular review, and not in the "fits and starts" fashion of recent years. We therefore enthusiastically make the following recommendations:

- 1. That a time plan be devised and approved in the current year to allow capital spending to proceed on a scheduled, continuous basis for thomographicals already planned and which the institutions can justify to be the most essential.
- 2. That at this time lowest priority be given to those capital proposals whose principal effect is to make the system of higher education more extensive, and whose existence must be justified primarily on projections of significant, system-wide enrollment increases.

Tables 10 and 11 are added for informational purposes.

TABLE 10

BOND AUTHORIZATIONS FOR CAPITAL PROJECTS IN HIGHER EDUCATION

IV. BUDGETARY PROCEDURES AND EXPENDITURE CONTROLS

61/62

## IV. Budgetary Procedures and Expenditure Controls

The two topics of this section's title can be discussed separately for expository purposes but are intimately tied in two ways. First, budgetary procedures represent one of the constituent units' principal connections with the state government and the Commission for Higher Education in the allocation of General Fund appropriations. And second, expenditure controls should be the means for monitoring the extent to which a unit's spending reflects the priorities or patterns set forth in the budgeting procedures.

The Resource Group realized rather quickly that it would not be able to construct a complete alternative set of allocation standards and procedures. Such an effort requires extensive research and the continuous involvement of budget officers of the constituent units, the Commission, and the state government, However, we will offer findings and recommendations which will hopefully provide the foundation for development of improved procedures and controls in the current Master Plan and in the subsequent biennial revisions of that Plan.

#### Findings:

- I. The existing calendar for preparing and adopting operating budgets is unsatisfactory in that it thwarts rather than promotes responsive, flexible and efficient institutional decision-making. There are three principal causes:
  - a. The shift from biennial to annual legislative sessions with no apparent measures to accelerate budget approval.
  - b. The requirements for repeated and unnecessarily duplicative submission of budget requests.

- The lack of preliminary commitment of a portion of anticipated budget dollars to allow institutions to hire qualified faculty at optimum times of the year.
- 2. The current policies of pre-audit controls of institutional spendary by the Department of Finance and Control interfere with educational decisions and prevent the continuing improvement of management competence at the institutional level. We see two reasons:
  - a. A different conception by the present state administration from previous administrations regarding the traditional role of public institutions with boards of trustees vis a vis other state agencies.
  - b. The lack of management information indices on which to assess and evaluate the spending of institutions of higher education.
- 3. While the Commission for Higher Education uses a formula to distribute its budget request among the constituent units (known as the SCHLDE technique, described briefly below and in detail in Appendix D), the current gubernatorial requests based solely on percentage increments of the previous year reduce the formula and its targets to mere ex post indices.
- 4. While the SCHLDE formula is a useful tool by which to allocate funds among various units, and levels within units, the targets are not sufficiently sensitive to program cost differences.

With regard to Finding 1, our discussions with officers of the four constituent units revealed to the Resource Group that there is a distinct awareness of the need for economy in operation and a genuine desire to improve the ability of institutions to respond to that need. However, the current budget preparation calendar fosters uncertainty and frustrates

efforts of flexibility and optimum resource use. An illustrative case is that of faculty hiring. Connecticut public institutions, especially since the advent of annual sessions of the General Assembly, are not able to participate fully in the academic labor market, which is at its height in December and January, when they have no commitment of funds until late spring or early summer for the academic year beginning in September. An institution's president must then either authorize commitments without approval or settle for less qualified people at later times of the year. While it is understood that the general Assembly's Finance and Appropriations Committee's reports are traditionally made at the end of the session, a preliminary commitment of a portion of anticipated funds could be made in the interests of promoting institutional flexibility.

Finding 2 refers to centralized control of daily institutional decisions, such as whether a secretary can be hired to replace one who suddenly leaves, whether a staff member can be authorized to travel to a professional meeting, or even whether lunch can be provided to participants of an institutionally related meeting. It does not suggest that institutions need not be accountable for public monies, but rather that such accountability should be postaudit. The principal difficulty with the current centralized controls is that they inhibit institutional <u>flexibility</u>. In the 1960's the growth of budgets itself provided a certain inherent degree of flexibility, which does not exist in current stand-still budgets. Yet it is in times of austerity when flexibility is most needed. In the Carnegie Commission's recent publication, The More Effective Use of Resources: An Imperative for Higher Education, the chapter on budget policy is entitled "Achieving Budgetary Flexibility", and its key recommendation is:

The Commission recommends that all institutions of higher education place emphasis on policies that will ensure budgetary flexibility..." (p. 103)

Every specific recommendation of the chapter is built upon flexibility,

We also cite the 1971 report of the Federal Technical Assistance Program, better known as the "flying feds," <u>Strengthening Management</u> and Budget Functions in the Connecticut State Government.

"The University of Connecticut should be provided general budget guidance by the Governor but otherwise should be accorded administrative flexibility in day-to-day operations..."

We support this recommendation and believe it should be expanded to all units. We also believe that the current development of a management information system should proceed as rapidly as possible so as to improve the chances of mutual understanding of institutional needs.

Findings 3 and 4 involve the method the Commission for Higher Education uses in its budget recommendation in order to adjudicate the claims of competing institutions. The principal unit of that method is the SCHLDE-student contact hour lower division equivalent. This technique builds into the budget preparation the idea that more faculty teaching hours are required to provide a given number of student contact hours as the level of instruction increases. For example, if one full-time teacher can offer 300 student contact hours of instruction per week at the lower division, it takes 1.667 full-time teachers to do the same at the upper division level. The weights are correspondingly higher at the graduate level. Thus an institution's budget needs depend, among other things, upon the number of students enrolled at each level.

While this concept is still broadly responsible for the distribution of funds among units, the actual aggregate budget recommendations of the Governor of recent years are purely incremental, based upon a percentage increase from the previous year, and ignore the Commission's target of

300 SCHLDE per full-time faculty member. It is estimated that in 1973-74 all units will be operating at over 400 SCHLDE per faculty member.

Additionally, several members of the Resource Group believe that budget recommendations should consider not only enrollment characteristics of an institution but the cost of programs at that institution. For example, the Community Colleges and Technical Colleges are considered "lower division" but are involved in occupational programs which are inherently more costly than most lower-division general education offerings. The SCHDLE technique is fully capable of being adapted for such use, but at present does not differentiate among <u>programs</u> in the assignment of weights.

The Resource Group offers the following recommendations:

- 1. That public institutions of higher education be allowed to make employment commitments, without prior approval for a portion of the new positions included in the Commission for Higher Education budget recommendations for the subsequent fiscal year so that they may participate in professional labor market at optimal times of the year.
- 2. That the Governor provide broad spending guidelines to the constituent units of public higher education, to be monitored and controlled by the boards of trustees and the administrative officers of each unit, and that existing pre-audit controls of day-to-day institutional decisions by the Department of Finance and Control be discontinued.
- That in order to improve budget planning and accountability, and to enhance mutual understanding of institutional decision making,

the development of a management information system proceed as rapidly as possible, and that the resources necessary for its development be provided as an appropriation to the Commission for Higher Education.

4. That the procedures and formulas for allocation of funds among constituent units be modified to include program cost differences and the need for support personnel.

V. THE INDEPENDENT INSTITUTIONS

## V. The Independent Institutions

The Independent colleges and universities in Connecticut comprise one of the state's principal resources and are major part of its educational history and tradition. It was only as recent as 1966 that enrollment in public institutions surpassed that in independent institutions. The members of the Resource Group believe that they bring a valuable dimension of pluralism to the higher education community in Connecticut and that this should be preserved.

The early deliberations of the Group on this topic reflected two generally held preconceptions, namely, that enrollment in all sectors would increase until 1978-79 and decline slightly thereafter, and that there was general excess capacity in the private college sector. led to the preliminary development of a position that the state provide the necessary funding to enable the independent colleges to absorb this peak rather than to expand the capacity of the public system. While there is little doubt of the validity of such a program, accepting the premises of growth and excess capacity, the problem appears to have become somewhat academic. First, it seems from all signs that total enrollment may already have leveled off, and second, while there are pockets of severe enrollment shortfalls in the private sector, most institutions are at capacity or very near it. In addition to the fact that the temporary enrollment crisis is not materializing, there have been two laws passed in recent sessions of the General Assembly which also reduced the need for the Resource Group to offer specific program recommendations.

Special Act 53. This legislation is designed to provide financial assistance to Connecticut independent institutions based upon the number of full-time undergraduate Connecticut residents they enroll. Eighty percent of

- 71 -

the funds are to be used for student financial assistance while 20% is unrestricted. The Act was funded in 1972-73 with approximately \$1.1 million.

Public Act 140. This legislation authorizes the Commission for Higher Education to enter into contracts with independent colleges in Connecticut for programs, services, and facilities "mutually beneficial to the citizens of the state and the independent colleges." While the act was not expected to be funded in 1972-73, it is likely that it will be funded in 1973-74.

We therefore summarize our findings and recommendation as follows:

### Findings:

- There is neither significant overall enrollment expansion anticipated, nor widespread excess capacity in the private sector to call for major new programs to channel students into independent colleges and universities.
- 2. Special Act 53 and Public Act 140 have the potential to provide the funding necessary for public access to the resources of the independent institutions, and no other programs are needed at this time.

# Recommendation:

It is recommended that pilot contracts under Public Act 140 be funded and commenced as soon as possible in order to create the knowledge, flexibility, and preparedness needed to utilize the resources of the independent institutions whenever the long run interests of state can be better served by so doing.

VI. APPENDICES

13/14

#### APPENDIX A

### INTERSTATE COMPARISONS

Ideally the most meaningful ratios would be to show both general fund appropriations and aggregate institutional expenditures per capita, per student, and per \$1000 of personal income. The purpose of each is sketched as follows.

# General Fund Appropriation vs Aggregate Institutional Spending for Current Operations

While the aggregate expenditure figures more clearly represent the actual cost of institutional operation, the appropriation figures show the extent to which the people of the state through general tax levies bear the burden of the educational cost.

Per Capita. This is a standard measure to compare the educational operation of states of different size with regard to the degree to which the aggregate dollar support actually serves the populace.

Per FTE Student. This figure is often used as a rough measure of quality of educational program for the students who are enrolled, but makes no indication of what portion of the population is being served. FTE (Full-time equivalent) students are usually counted by adding the total number of full-time students plus 40% of the part-time students.

Per \$1000 of Personal Income. Some states are blessed with prosperity more than others. This measurement, especially when it refers to general appropriations, is an indicator of tax e ort based upon ability to pay. It is usually lower for states with a considerable number of independent institutions.

While there is fairly complete data on expenditures, information regarding the sources of revenue, -- the largest being governmental general

appropriations, -- have many severe limitations. The most complete data can be found in <u>Financial Statistics of Institutions of Higher Education</u>, published by the Office of Education of the Department of Health, Education and Welfare, but it is often not ed to be useful. At the writing of this report the most recent was for the year 1967-68. An often cited yearly summary of state government appropriations for higher education is that of Chambers in the publication <u>Grapevine</u>. These figures have decided <u>limitations</u> when used for comparative purposes.

The important limitations are:

- I. They do <u>not</u> include the support of local governments for higher education. Such support exists in more than half of the states and is a major part of the support in several.
- 2. They include costly appropriations for such things as educationally affiliated hospitals and agricultural extension programs in some states and not others.
- They do not account for differences in the collection of tuition.

  In some states tuition is kept by the collecting institution and thus is not appropriated, while in others (Connecticut being one) the tuition is paid to the general fund of the state government, thus making the official appropriation higher than the net state contribution.

To the knowledge of the Resource Group members and other people consulted, there does not exist a current set of data without these limitations. The making of accepte state-by-state comparisons will probably have to await speedier production of the previously cited reports of the Office of Education of the Department of Health, Education, and Welfare.

We have, however, reproduced in Tables A-1, A-2, and A-3 data appearing in recent issues of two respected and widely-read publications, <u>The Chronicle of Higher Education</u> and <u>The Journal of Higher Education</u>. While, again, precision is not to be gained from these tables, some general directions are suggested.

Regardless of whether Connecticut's rank is really 35 or 45, or whether we spend more or less than a particular state, it seems a fair conclusion a distinct majority of states spend more on public higher education than does Connecticut, whatever index is used.

The governmental spending level for public higher education or any other state service in Connecticut has never been, nor do we recommend that it ever be, one of extravagance. We respect a tradition of frugality. We also recognize that the long history of private higher education in the state has and will continue to temper the need for public facilities. However, we assert that there is room for improvement relative to other states, and that such improvement would only be in the best interests of our future with no damage to our tradition.

The table above shows how much of its tax funds each state is spending, per capita, for the operating expenses of higher education in 1971-72. The information was compiled by The Chronicle from figures supplied by M. M. Chambers of Illinois State University and from the U.  $\tilde{S}$ . Bureau of the Census's estimate of civilian population as of July 1, 1972.

#### APPENDIX 6

Estimated Addition of the University of Connecticut Health Center and the Commission for Higher Education Budgets to Projections of Table 2

- 1. <u>Health Center</u>. The estimated spending data are added as submitted by Health Center authorities in January, 1973.
- 2. Commission for Higher Education. The estimated spending data are computed as 4% of the total of the four units and the Health Center.

#### APPENDIX C

Computation of Instructional Cost per FTE Student

For those tuition proposals based upon the state general fund cost per student for instruction it is necessary to compute that cost for each constituent unit and at each level (lower division, upper division, graduate). This involves two steps:

First, it is necessary to exclude from the total appropriation that which is not for instruction. To do this for the University, for example, one must deduct those amounts specifically appropriated for organized research, public service, and a proportionate amount of that for the library, the operation and maintenance of the physical plant, and general administration. Also deducted is the University contribution for tinancial aid.

Second, this adjusted budget is divided by FTE students in the State Technical Colleges and Community Colleges, and apportioned to levels by the SCHLDE technique at the State Colleges and the University.

# A. The University of Connecticut

			<u>SCH</u>	SCHLDE
Appropriation	\$43,450,861	LD	148,810	148,810
Less Non-instructional	8 220 443	UD	115,518	192,569
Expenditures	and the second s	Ğ	45,273	175,065
Total Instructional Cost	35,230,418	Tot	309,601	516,444

Cost per SCHLDE =  $$35,230,418 \div 516,444 = $68.21$ 

	(1) SCHLDE	(2) Cost/SCHLDE	(3) (1) x (2)	(4) FTE Enr.	(5) Instr. Cost/FTE (3) + (4)
LD	148,810	\$ 68.21	\$10,150,330	7,900	\$1,285
UD	192,569	68.21	13,135,131	7,595	1,729
G	175,065	68.21	11,941,184	3,910	3,054

# B. The State Colleges

			<u>SCH</u>	SCHLDE

#### The State Technical Colleges

Appropriation

\$4,453,158

Less Non-instructional

Expenditures

713,582

Total Instructional Cost 3,739,576

instructional Cost per FTE =  $\$3,739,576 \div 2,500 = \$1,496$ 

# D. The Regional Community Colleges

The appropriation to the Regional Community Colleges includes lease costs as explained in section I.B. of this report. This must be excluded in the computation of instructional cost. The method was to multiply the 1972-73 cost per student excluding lease costs (as listed in the CHE budget document) times the number of FTE students. From that, non-instructional expenditures were subtracted.

Appropriation Minus Lease Costs \$15,173,760

Less Non-instructional

Expenditures

683,480

Total Instructional Cost

14,490,292

Instructional Cost per FTE = \$14,490,292 : 15,806 = \$917

#### APPENDIX D

#### The SCHLDE Technique

THE WEIGHTING SYSTEM USED FOR COMPUTING REQUIREMENTS FOR FACULTY POSITIONS

In 1967 the Connecticut Commission for Higher Education introduced a system of weighting student contact hours by level of instruction, in order to relate requirements for faculty positions more precisely to the varying missions of different constituent institutions than would be possible using simple enrollment counts. The weighting system takes lower division (freshman-sophomore) instruction as the basis of calculation, and then converts upper division (junior-senior), terminal Master's, and mixed Master's and Doctoral work student contact hours (SCH) into student-contact-hour-lower-division equivalents.

The precise derivation of the weights, in the form authorized by the Commission, is shown in the attached table. This table assumes that the average lower division class will have 25 students, and that a full-time teaching load at this level will involve 12 teacher contact hours per week. The number of student contact hours defining a full-time teaching load at this level will thus be  $25 \times 12$ , or 300.

Progressively smaller sized classes and teaching loads are assumed for the more complex and specialized work at the higher levels of instruction, producing the SCH per instructor for each level shown in column 3. Each of the figures in column 3 is then divided int. 300, the lower division standard, in order to determine how many faculty would be required at each of these higher levels, to teach 300 student contact hours per week. The resulting weights are shown in column 4.

The institution then determines its faculty requirements by counting or estimating the total number of student contact hours at each level, and multiplying the number at each level by the appropriate weighting factor from column 4, adding the resulting student-contact-hour-lower-division-equivalents (SCHLDE), and dividing the sum by 300, or by whatever standard is set.

In the budgeting process, Connecticut institutions have, in the past, used the target of 300 SCHLDE per position as the uniform budgetary goal. This target has then been adjusted by the Budget Division to a level considered more nearly consistent with budgeting realities. In the Fall of 1970, for instance, the University of Connecticut actually experienced 353 SCHLDE per authorized faculty position.

In the absence of new positions for the Fall of 1971, and given expected enrollments, the ratio for 1971-72 is expected to be about 371 SCHLDE per authorized position.

If no new positions are granted for 1972-73, and enrollments continue to rise as expected, the ratio will rise to about 393 SCHLDE per position, indicating an 11.3 percent decline in standards in terms of class size and teaching loads over the two years.

It must be understood that the standard ratios apply to the entire institution at the highest level of aggregation. They will, and indeed, should, vary among individual programs, depending on such factors as the pedagogical problems of the discipline, and demand for individual courses.

The SCHLDE concept has proved extraordinarily useful in providing indices of shifting quality standards. In the budget review process its

great advantage is its extreme sensitivity to differences among institutions in enrollment mix among levels of instruction, and to changes in enrollment mix within a given institution.

Table 1. Weighting system used by Connecticut Commission for Higher Education to assess requirements for teaching faculty in constituent institutions.

Level of instruction involved	Students per class (SCH/TCH)		Class hours per faculty member (TCH/FTTE)		'SCH per instructor (SCH/FTŤE) (3)	SCHLDE/SCH = Instructors (FTTE) per 300 SCH a/ (4)
Regular Courses		,				
Lower Division Upper Division Terminal master's and	25 20	×	12 9	==	300 180	1 1.667
first professional Master's and Doctorate		X	-	=	90	3.333
combined Doctorate only	12.5 10	×	6 6	= =	75 60	4 5
Independent study (undergraduate and graduate)						
25 enrollments x 3 ass lents = 75 (simulated)		act	t hour equiva	a-		. 4
Thesis and dissertation	supervisio	on.				
25 enrollments x 3 ass lents = 75 (simulated)		act	t hour equiva	a-	·	4

a/ Weighting factor for differentiating among levels of instruction. SCHLDE is a student contact hour lower division equivalent. It shows the number of instructors required per 300 SCH at each level of instruction.

$$N = FTTE \left( \frac{SCH}{TCH} \right) \left( \frac{TCH}{FTTE} \right)$$

Assuming that each unit (excluding the Health Center of the University) requires the same per FTE student support in dollars of constant purchasing power (i.e. building in 4 percent inflation per year) the low and high estimates of future general fund spending are listed below.

Low Estimate	High Estimate
\$ 96,590,658	\$ 96,590,658
101,666,947	104,952,150
106,545,410	115,017,104
111,869,337	127,057,739
117,528,961	138,416,628
123,612,372	152,177,964

If a collective bargaining agreement were to cause the personnel services portion of the units' budgets to increase at, say, 5.5 percent per year, the estimates would increase as follows:

Low Estimate	High Estimate
\$ 97,882,190	\$ 97,822,190
104,518,700	106,290,280
111,435,830	120,296,380
119,381,360	135,589,660
127,219,220	149,829,080
136,115,760	167,570,760

b. What are the major potentials for cost reduction?

The major potentials for reducing unit costs are degree options which reduce the required amount of formalized and supervised learning, and measures which reduce or avoid statewide or regional program duplication, course proliferation, and other arrangements which cause small classes where they are not required pedagogically.

Such steps are not simple, however, and require full assessment of effects upon program quality and objectives.

- c. What should be the proportion of operating costs (tuitions, fees and room and board) borne by: 1. State, 2. Federal, 3. Student/Family, 4. Other?
- d. What would be the effects of apportioning costs of highe solution on ability of students to pay?

The Resource Group did not create a schedule of percentages by which costs should be allocated. Rather we respond with the following positions.

- The State should assume a substantially greater portion of the cost of student aid in the form of scholar incentive grants.
- The students' contribution should depend upon the level of program he is pursuing and his ability to pay. That is, tuition should be lowest in the lower division and highest at the graduate level, and scholar incentive grants should vary inversely with yearly family income.
- . The provisions of the Federal Higher Education Ammendments of 1972 have the potential of increasing the Federal share of institutional and student expenses, but funding is not expected in the next few years.

The effect of increasing student financial assistance and awarding it on basis of ability to pay will be to make the public institutions more representative of the population.

e. What are cost barriers to higher educational opportunity?

Full-time attendance at a Connecticut public institution involves considerable planning and sacrifice for the average Connecticut student and his family. Yearly out-of-pocket costs range from \$1,600 at a community college to more than \$2,500 at the University. In a sample of twenty-one states Connecticut ranked as the fourth most expensive for tuition and required fees at the University and State College level. Without adequate student financial assistance in the form of grants, the current (or higher) costs will exclude from our institutions low income people, especially those without a family tradition of higher education.

f. For what programs/services/facilities should the state contract with independent colleges?

Public Act 140, which provides for contracting with the independent institutions, is not restricted to any list or categorization of services and the Resource Group does not believe it should be.

The Resource Group believes that Public Act 140 should be funded as soon as possible so that the Commission for Higher Education may be prepared to contract with the independent institutions as the needs of the state dictates.

g. What are potential implications of collective bargaining?

The principal potential implication is, of course, increased operating budget needs, but there are reasons to believe that this will not be realized, at least in the coming few years.

First, while many people expect that a collective bargaining agreement will soon be reached, it is far from certain. Second, it is not clear what the bargaining units or agents will be. And, third the current buyers' market for professional educational labor will tend to temper salary agreements.

The response to question "a", above, shows the effect of a 5.5 percent yearly increase in salaries at the public institutions.
